

Fenmo Assignment: Data Operations Intern

Problem Statement

- Pick any digital app or service you personally use often (food delivery, ride-hailing, streaming, shopping, investment, etc.).
- Create a dataset of at least **50 rows and 10+ fields** that fairly represent actual user activity in that app. Think about what the app would naturally log in a transaction or event.
- Examples of fields you can think of:
 - **Identifiers** (e.g., a transaction ID or user ID)
 - **Numeric values** (e.g., amounts, counts, durations)
 - **Categorical fields** (e.g., status, method, type)
- Write the significance of each field, in not more than 6-8 words per field.
- Highlight 3 to 5 realistic issues / error types per field that could inject errors or discrepancies in production data - not random typos, but for example, inconsistent totals, duplicates, contradictions, edge cases, missing values, or impossible ranges, etc.
- Recommendations how these errors could be avoided in real-life scenarios

Submission Instructions

Upload the submission file (Dataset, Definitions, Errors, Recommendations in a single file) in .xlsx or .csv format

Evaluation Parameters

- Breaking down a familiar application into meaningful and structured fields
- Anticipating how real-world data could go wrong
- Communicating ideas and recommendations clearly and concisely
